

Bioplastics 101

Bioplastic refers to materials that are either **biodegradable, plant-based** (derived from renewable sources like sugarcane), or both. **Comparable to conventional plastics, they often offer further advantages, such as a reduced carbon footprint with I'm green™ bio-based.**

Recycling **keeps carbon within a closed loop**, embodied in the material until its end of life (EoL). Drop-in solutions such as **I'm green™ bio-based PE** can be mechanically **recycled in existing recycling streams**. In contrast, biodegradable plastics are broken down under **certain environmental conditions**, releasing carbon back into the ecosystem as CO₂. Eventually, bioplastics too will degrade, but this process takes much longer.

It's like traditional plastic, but made from plants

Choose plant-based plastic.
The small change with a big impact.

I'm green
BIO-BASED
LIKE TRADITIONAL PLASTIC
BUT MADE FROM PLANTS
